

Image-Space Horizon-Based Ambient Occlusion

SIGGRAPH 2008

Louis Bavoil, Miguel Sainz

NVIDIA

Sky Light

- Simplest form of Ambient Occlusion
 - Light source = sky (sphere light)
 - Two definitions of AO
 - AO = diffuse illumination from the sky [Landis 02] [Christensen 03]
 - AO = shadow from the sky illumination [Pharr and Green 04] [Hegeman et al. 06]
 - Limited to outdoor scenes

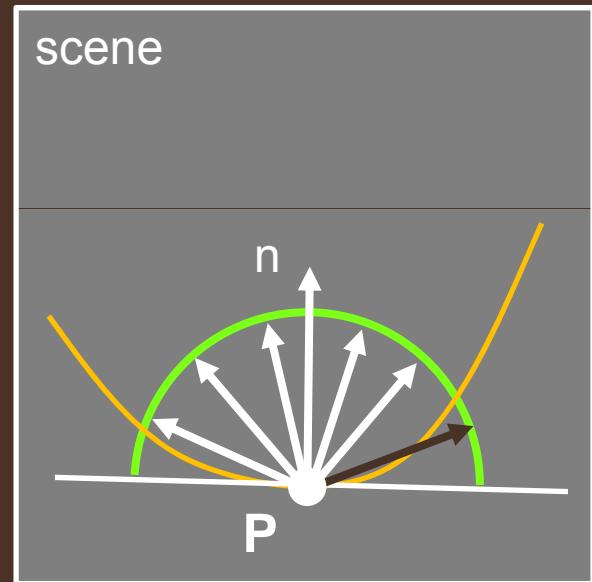

sphere light

NVIDIA.

Ambient Occlusion

- Light = local hemisphere
 - Centered at current surface point
 - Radius = user parameter
- Can be rendered with ray-tracing
 - [Gelato] [Mental Ray]

local sphere light

SIGGRAPH2008

Ambient Occlusion

- Gives perceptual clues of depth, curvature and spatial proximity

Without AO

With our AO

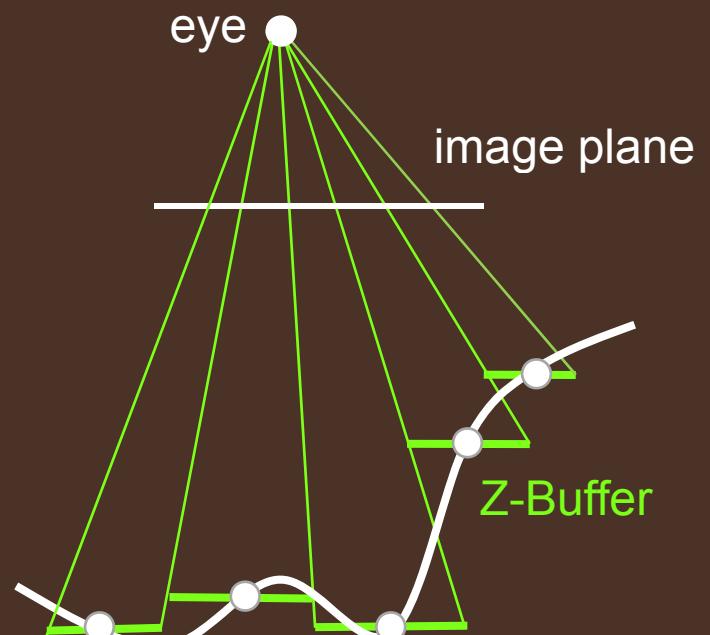

SIGGRAPH2008

Screen Space Ambient Occlusion

- Approach introduced by
 - [Shanmugam and Orikan 07]
 - [Mittring 07] [Fox and Compton 08]
- Input = Z-Buffer + normals
 - Render approximate AO for dynamic scenes with no precomputations
- Z-Buffer = Heightfield
 - $z = f(x,y)$

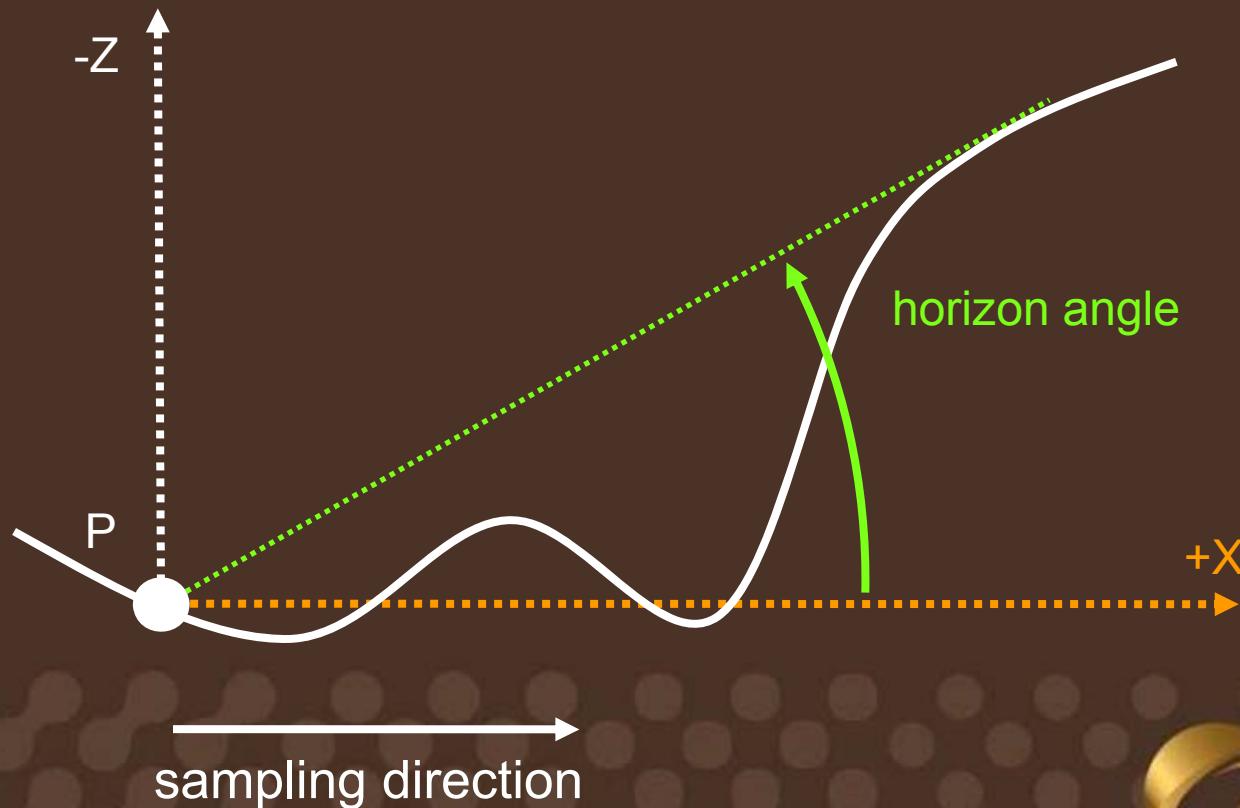

SIGGRAPH 2008

NVIDIA.

Horizon Mapping [Max 86]

- Given a 1D heightfield

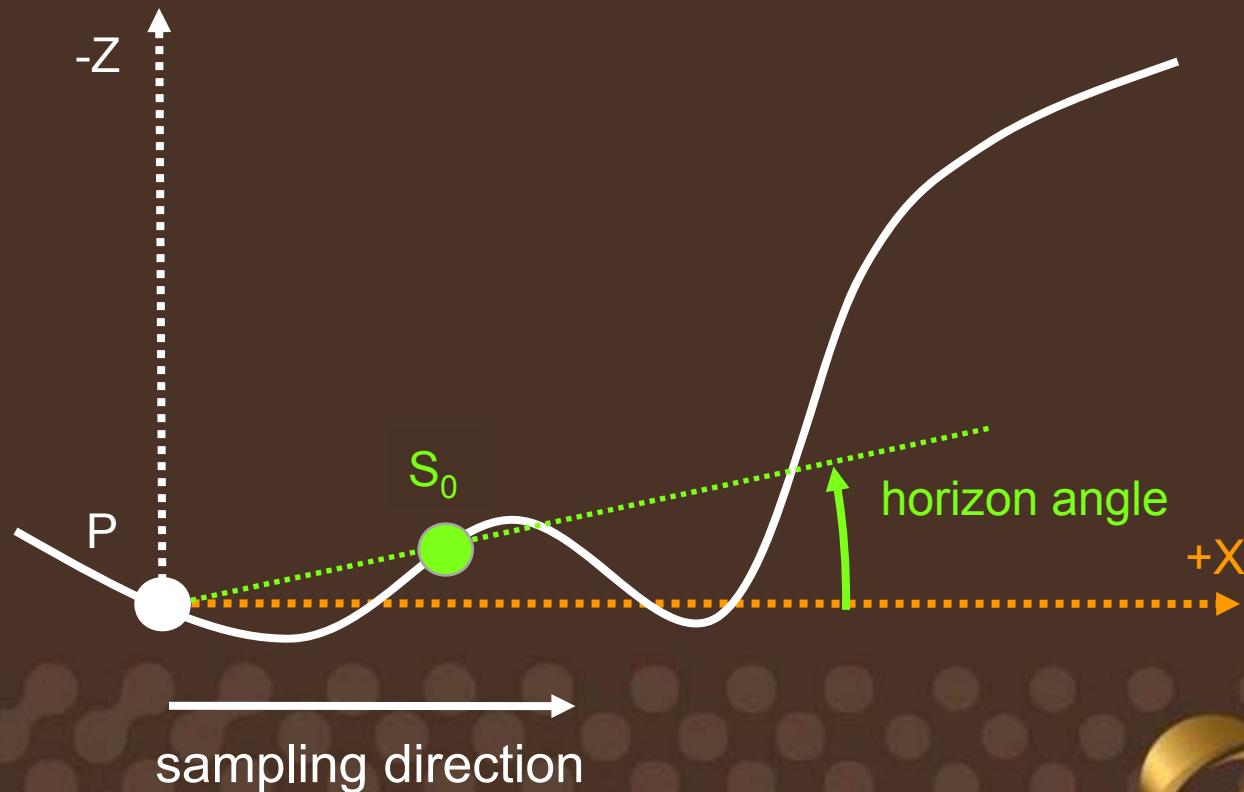

SIGGRAPH 2008

NVIDIA.

Finding the Horizon

- Marching on the heightfield

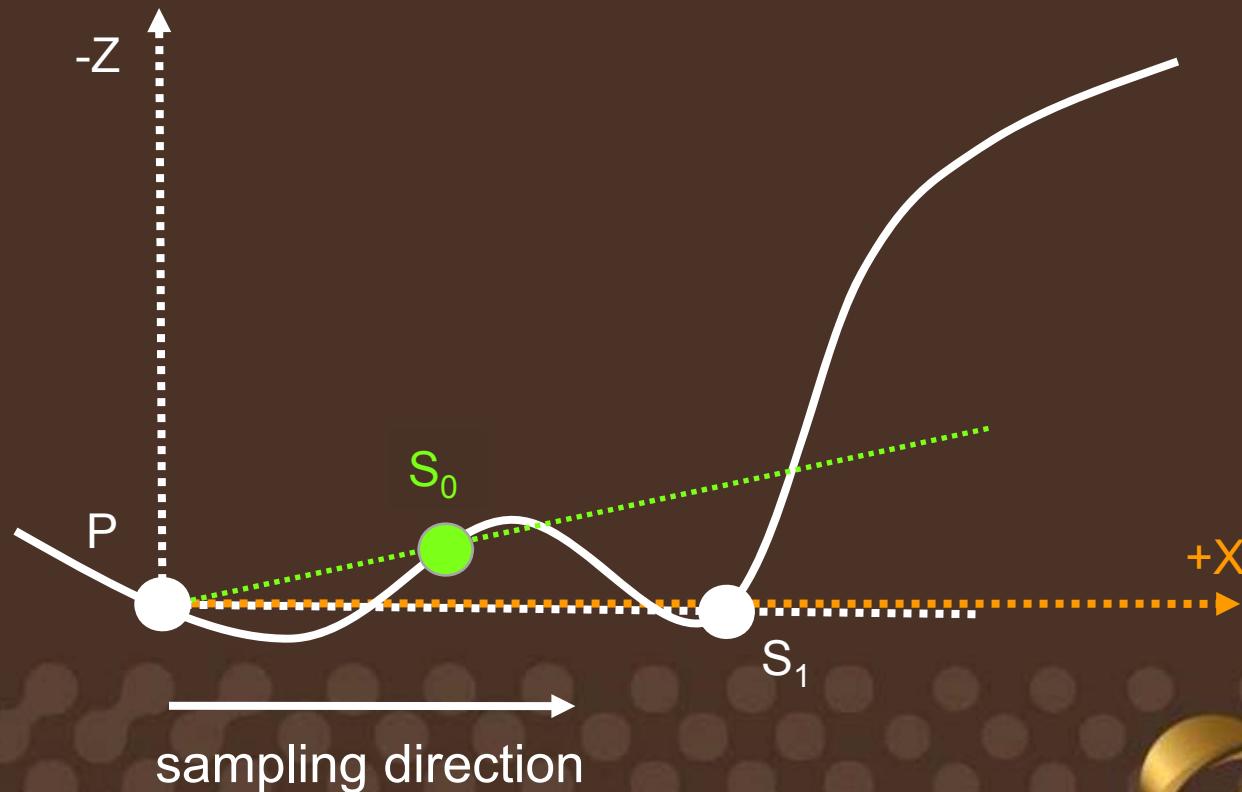

SIGGRAPH 2008

NVIDIA.

Finding the Horizon

- Marching on the heightfield

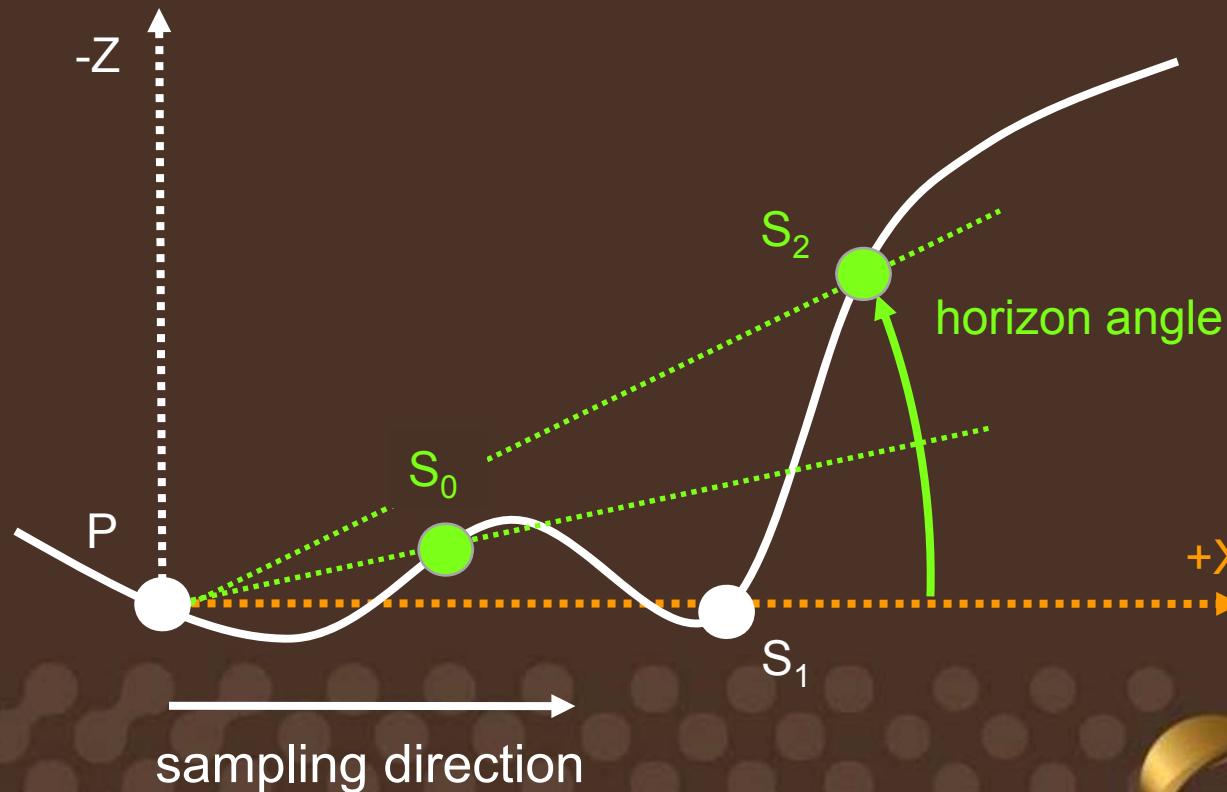

SIGGRAPH 2008

NVIDIA.

Finding the Horizon

- Marching on the heightfield

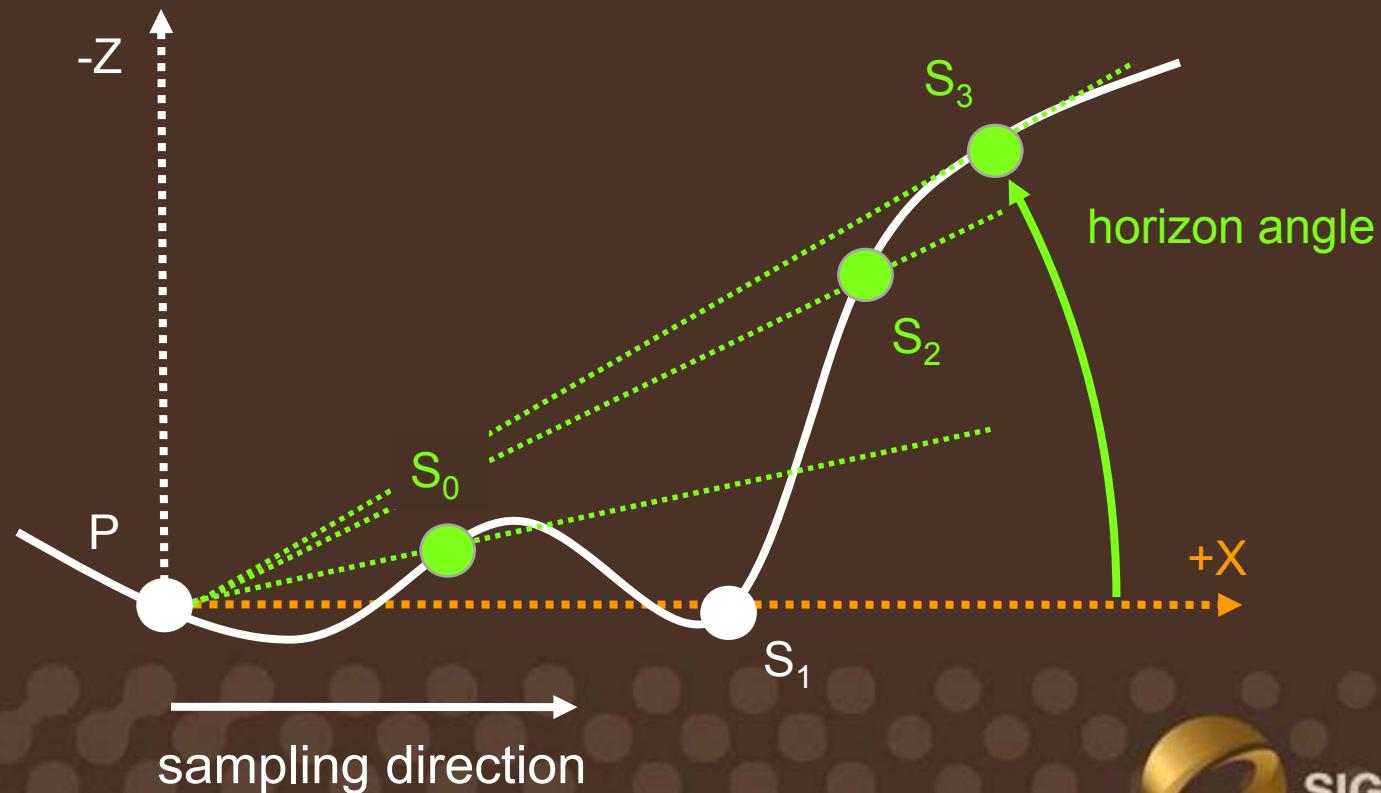

NVIDIA.

Finding the Horizon

- Marching on the heightfield

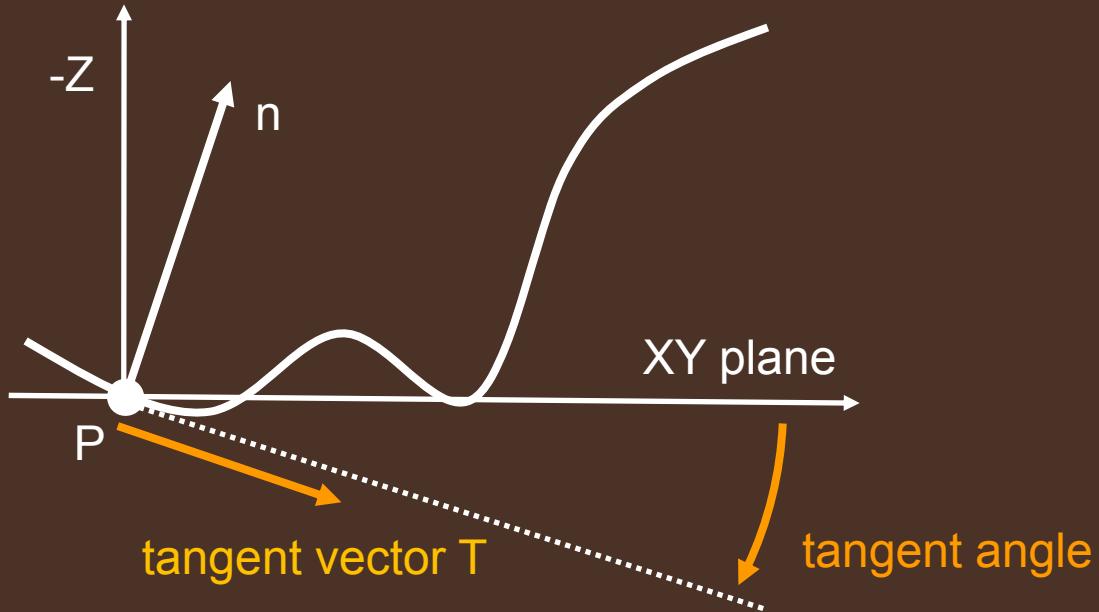

SIGGRAPH 2008

NVIDIA.

Tangent Plane

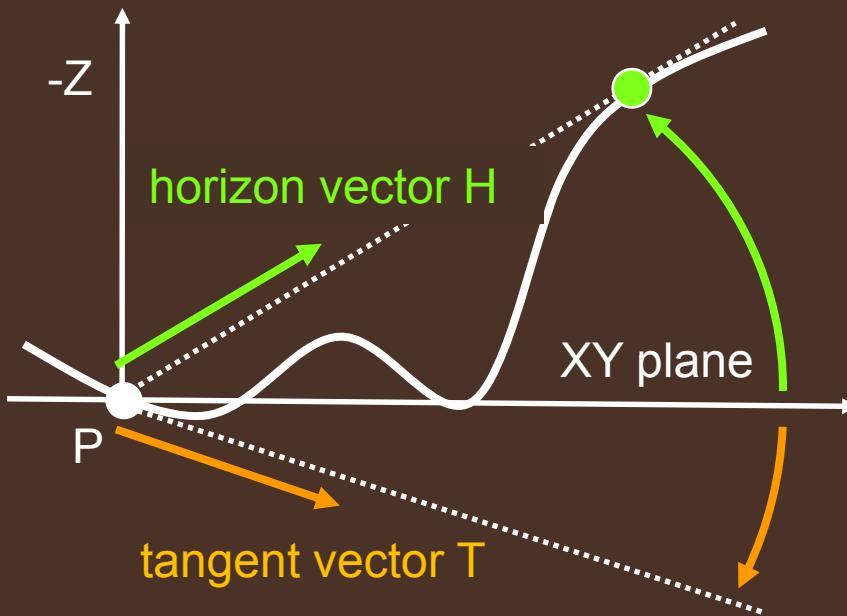

- Given point P and its normal n

NVIDIA.

Horizon-Based AO

horizon angle in $[-\pi/2, \pi/2]$
 $h(H) = \text{atan}(H.z / \|H.xy\|)$

tangent angle in $[-\pi/2, \pi/2]$
 $t(T) = \text{atan}(T.z / \|T.xy\|)$

$$AO = \sin h - \sin t$$

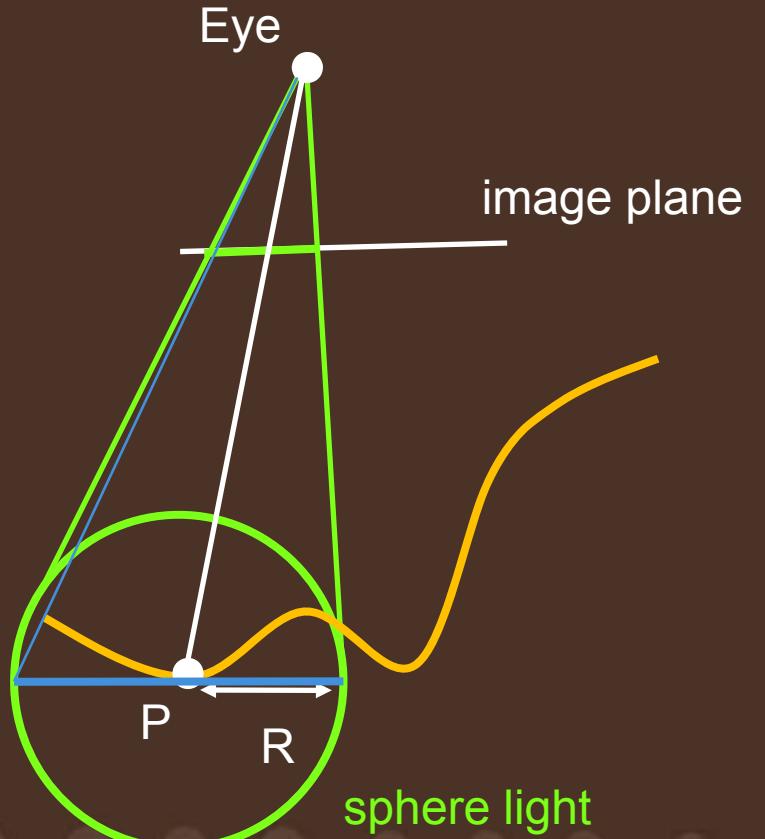

SIGGRAPH 2008

NVIDIA.

Ambient Occlusion Radius

- Ambient occlusion radius defined in eye space
 - Scene = depth image
- Project light sphere into texture space
 - Approximate projection of the sphere by a disk
 - Project disk onto uv space

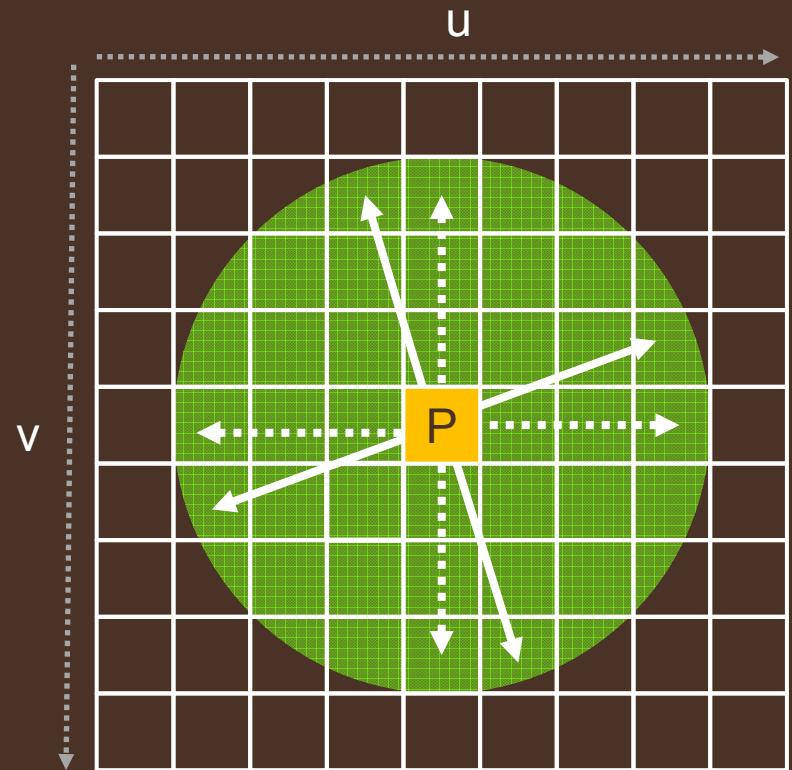

SIGGRAPH 2008

NVIDIA.

Sampling the Depth Image

- Use uniform distribution of directions per pixel
 - Fixed num samples / dir
- Per-pixel randomization
 - Rotate directions by random per-pixel angle
 - Jitter samples by a random offset

Example with 4 directions / pixel

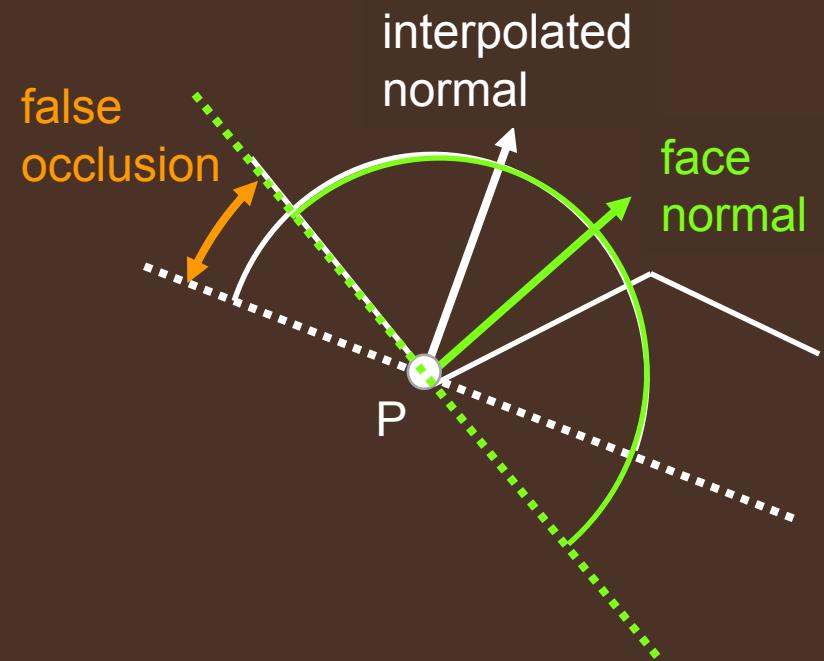

SIGGRAPH 2008

NVIDIA.

Normals

- We store per-pixel normals
 - Not interpolated normals
 - Would generate false occlusion
 - But face normals
 - Using ddx/ddy instructions on eye-space coordinates in the geometry pass

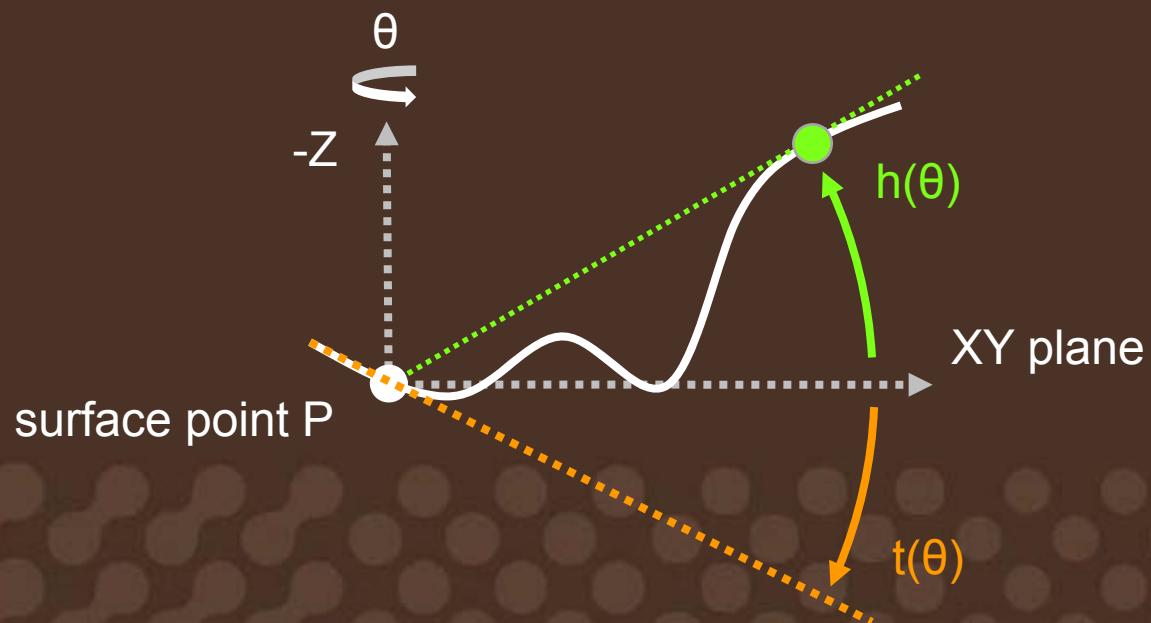

SIGGRAPH 2008

NVIDIA.

Core Algorithm

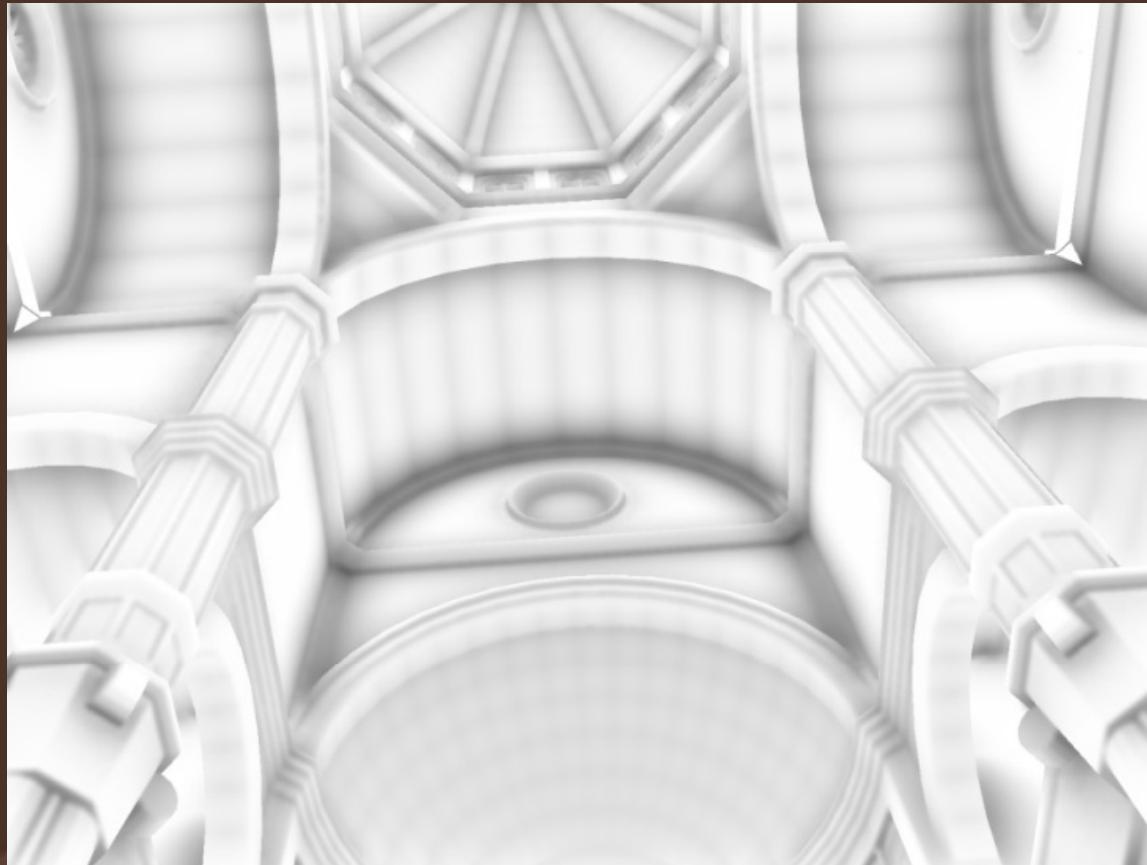

- Integrate AO in 2D
 - Average AO over multiple 2D directions θ
 - $\text{AO}(\theta) = \sin h(\theta) - \sin t(\theta)$

NVIDIA.

Ambient Occlusion in Creases

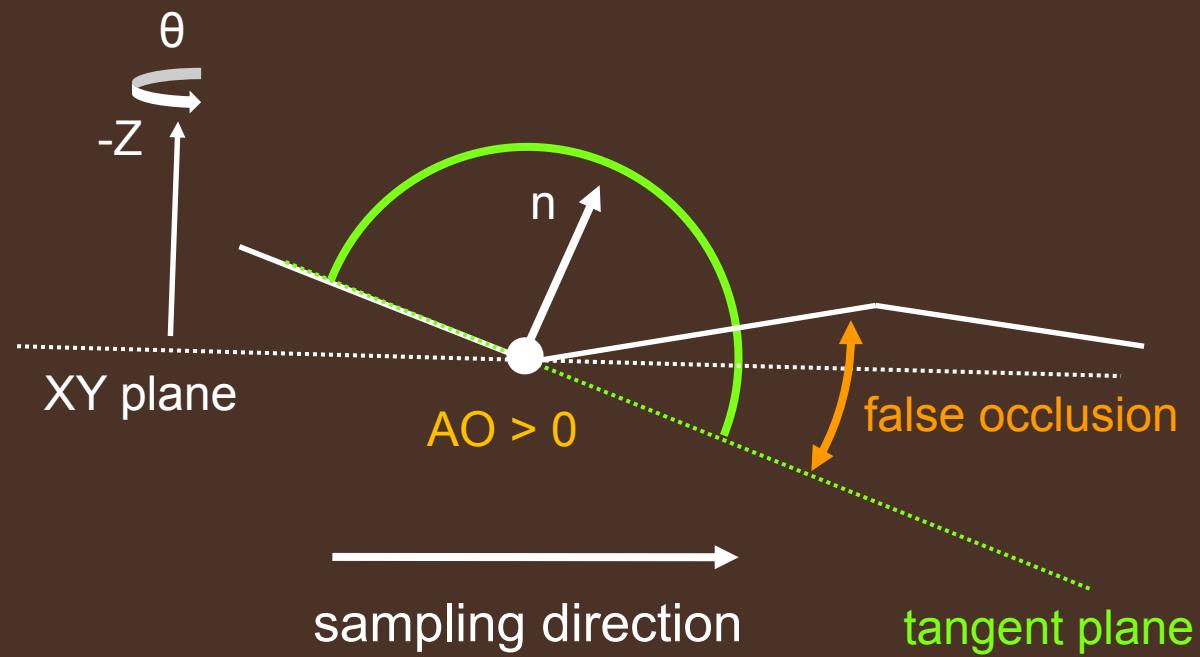

SIGGRAPH2008

NVIDIA.

Low-Tessellation Problem

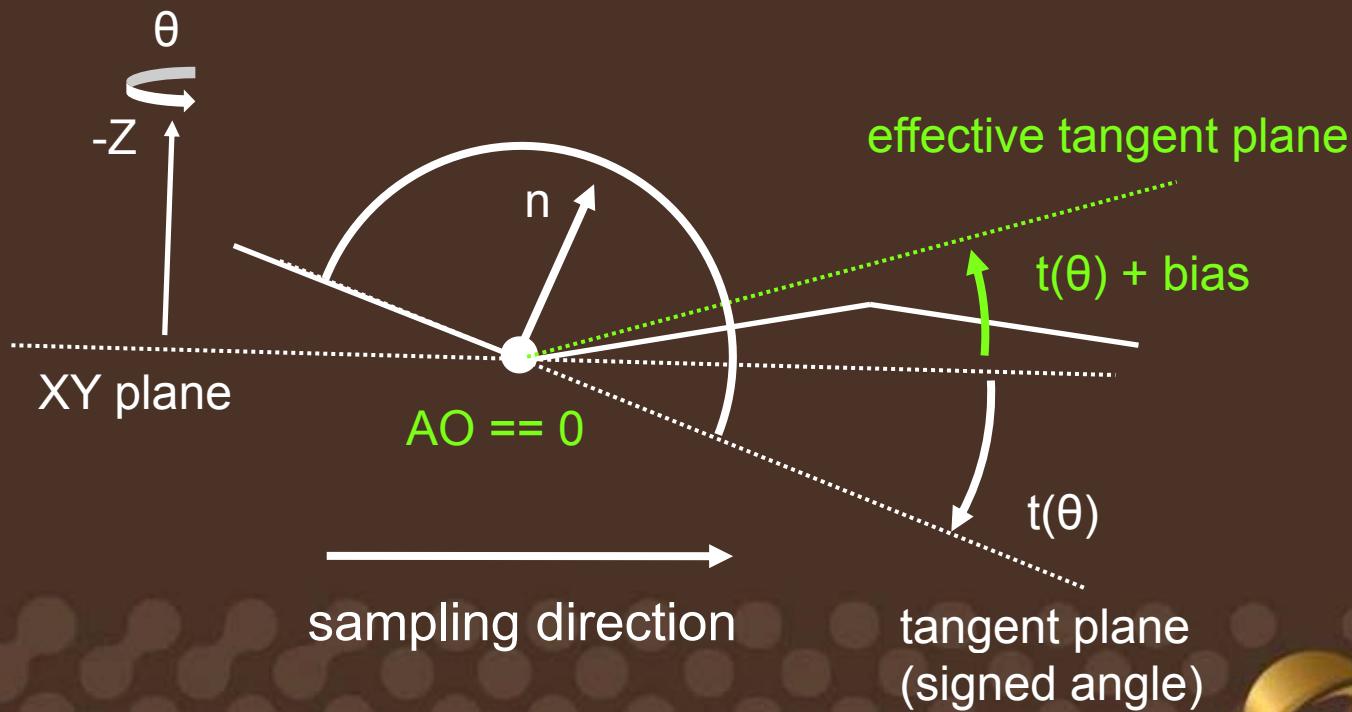

SIGGRAPH 2008

NVIDIA.

Solution: Angle Bias

- Similar to “spread” parameter in [Mental Ray]
- Ignore occlusion near the tangent plane

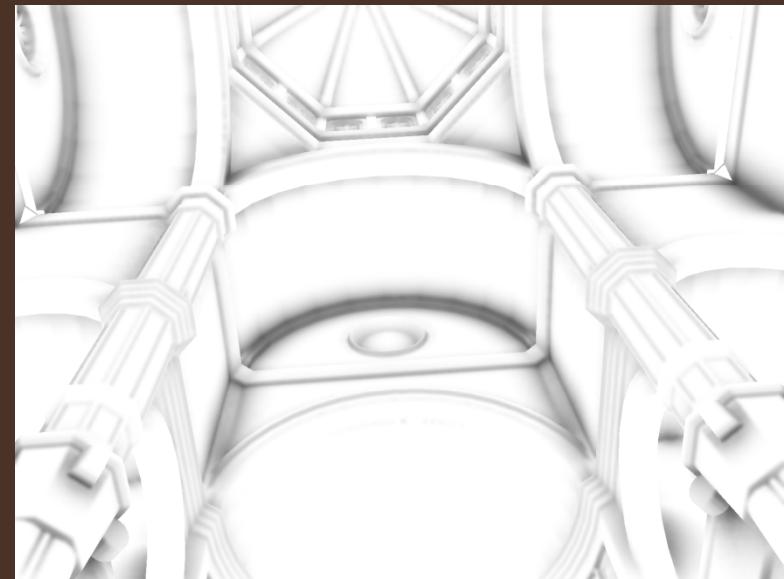

SIGGRAPH 2008

The Angle Bias in Action

Without angle bias

With angle bias = 30 deg

NVIDIA.

Sampling Outside the Screen

- No scene information outside view frustum
 - We remove false occlusion by using clamping to edge and an angle bias

angle bias = 0

angle bias = 30 deg

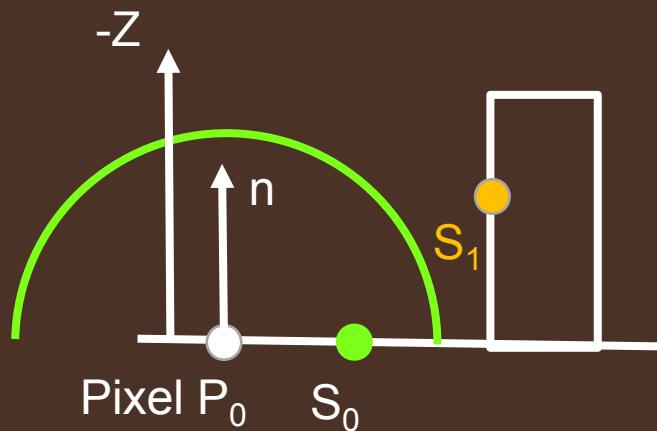

SIGGRAPH 2008

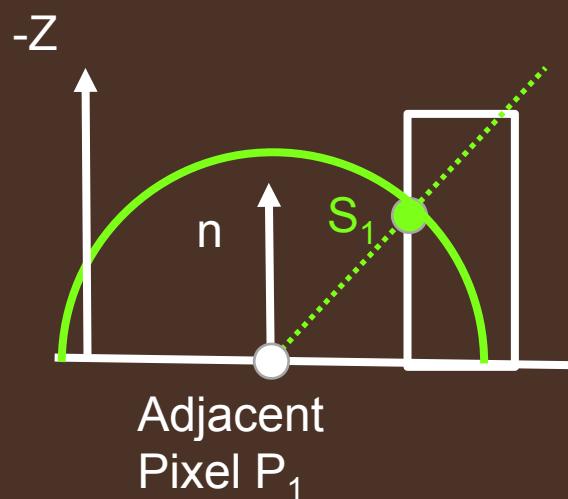

NVIDIA.

Discontinuity Problem

$$\begin{aligned} \text{AO}(P_0) &= \sin h - \sin t \\ &= \sin 0 - \sin 0 = 0 \end{aligned}$$

$$\begin{aligned} \text{AO}(P_1) &= \sin h - \sin t = \\ &= \sin(45\text{deg}) - \sin 0 = 0.7 \end{aligned}$$

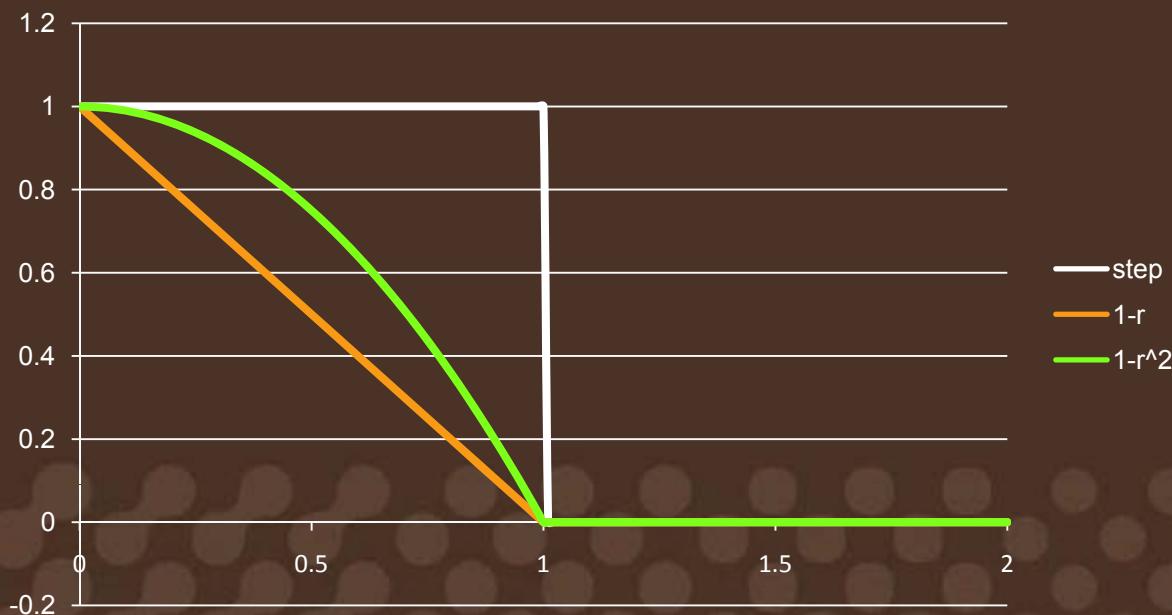

→ Large AO discontinuity between P_0 and P_1

NVIDIA.

Attenuation Function

- Weight AO by a radial function $W(r)$
 - Similar to obscurances [Zhukov et al. 98]
 - “Falloff” in [Gelato] and [Mental Ray]

Normalized distance
 $r = \|S - P\| / R$

We use the attenuation
 $W(r) = 1 - r^2$

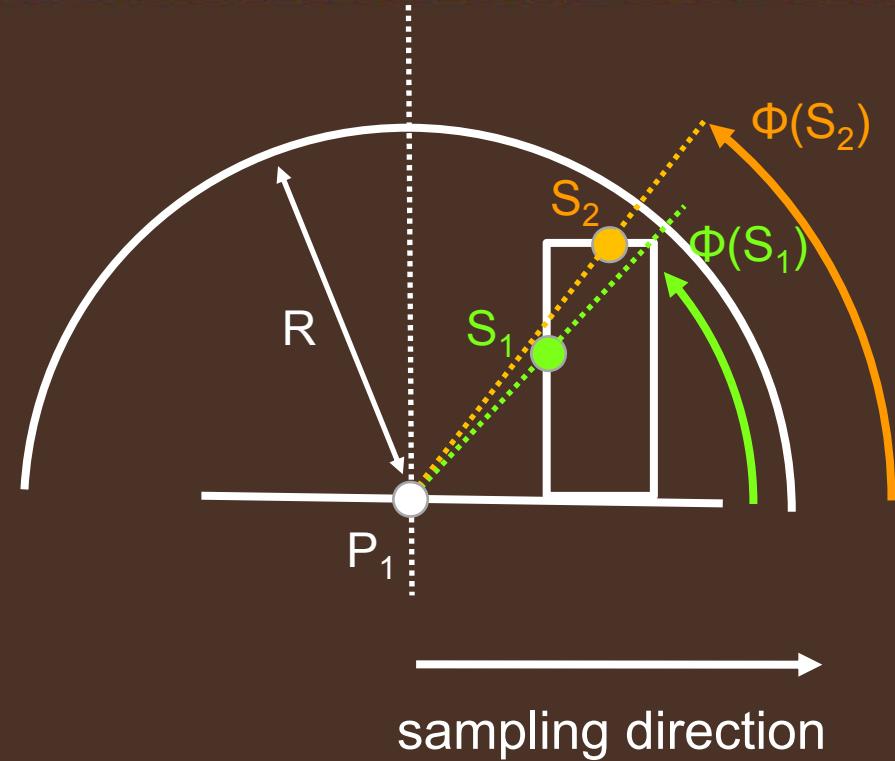

SIGGRAPH 2008

NVIDIA.

Per-Sample Attenuation

- Initialize WAO = 0
- After sample S_1
 - $\text{AO}(S_1) = \sin \Phi(S_1) - \sin t$
 - $\text{WAO} += W(S_1) \text{AO}(S_1)$
- After sample S_2
 - If $\Phi(S_2) > \Phi(S_1)$
 - $\text{AO}(S_2) = \sin \Phi(S_2) - \sin t$
 - $\text{WAO} += W(S_2) (\text{AO}(S_2) - \text{AO}(S_1))$

SIGGRAPH 2008

With and Without Attenuation

With Attenuation

$$W(r) = 1 - r^2$$

Without Attenuation

$$W(r) = 1$$

SIGGRAPH2008

Noise

- Per-pixel randomization generates noise

AO with 6 directions x 6 steps/dir

Cross Bilateral Filter

- We blur the ambient occlusion
- Depth-dependent Gaussian blur
 - [Petschnigg et al. 04]
[Eisemann and Durand 04]
 - Reduces blurring across edges
- Although it is a non-separable filter, we apply it separately in the X and Y directions

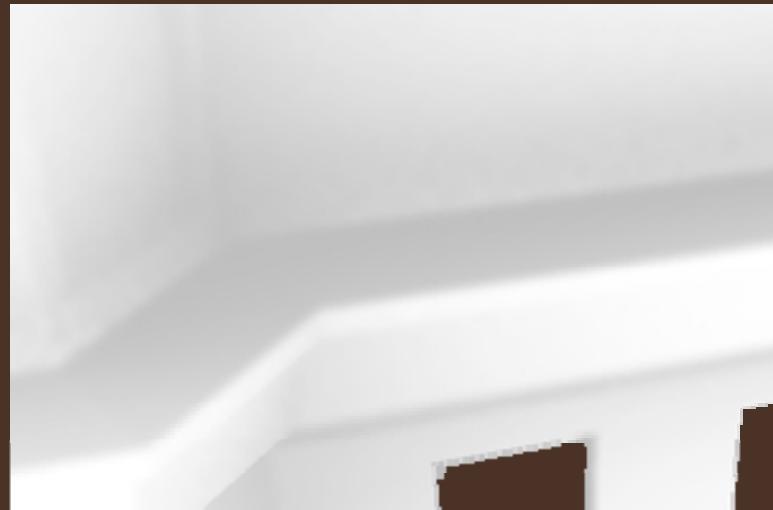

Cross Bilateral Filter

- Depth-dependent Blur

Without Blur

With 15x15 Blur

SIGGRAPH2008

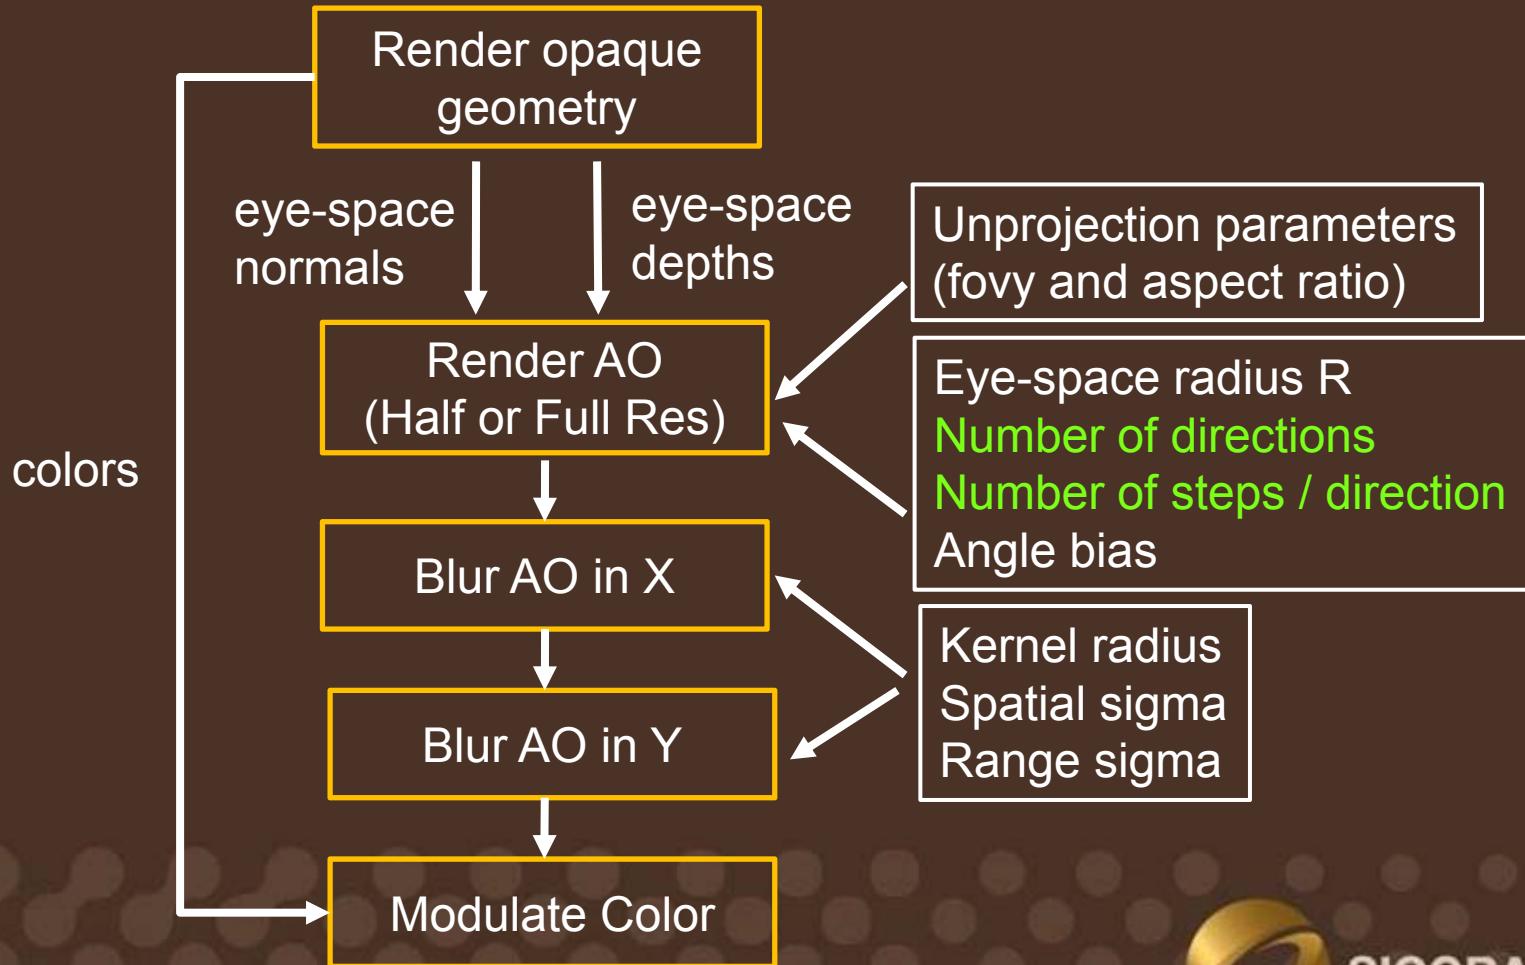

Half-Resolution AO

- AO is mostly low frequency
 - Can render the AO in half resolution
 - Source half-resolution depth image
- Still do the blur passes in full resolution
 - To avoid bleeding across edges
 - Source full resolution eye-space depths
 - [Kopf et al. 07]

NVIDIA.

Rendering Pipeline

SIGGRAPH 2008

Demo

SIGGRAPH 2008

Performance

- Depends on
 - Screen Resolution
 - Ambient Occlusion Resolution
 - Number of samples (directions * steps)
 - Blur Size

NVIDIA.

Half-Resolution AO

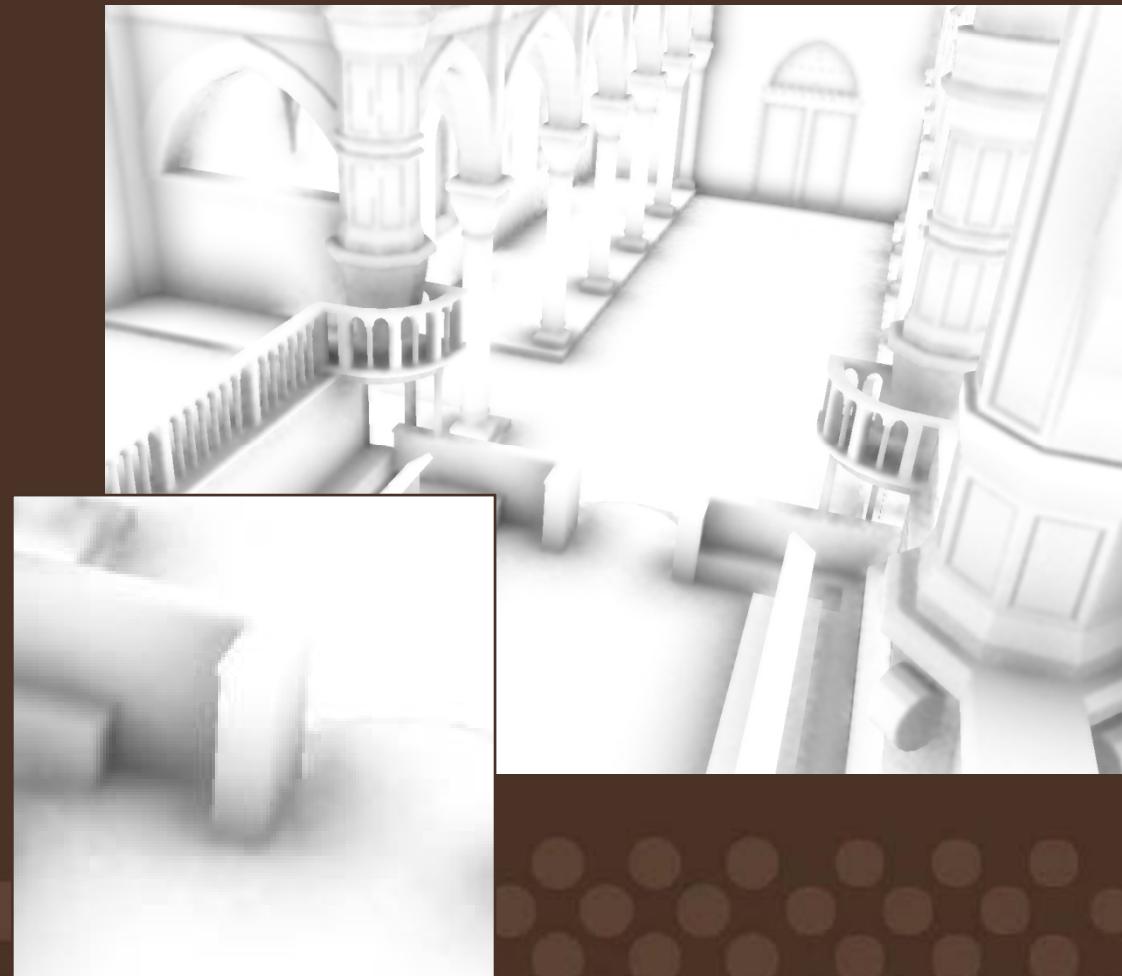

Image Size 1600x1200

AO Resolution 800x600

Blur Resolution 1600x1200

Half-Res AO	GeForce GTX 280
Geometry	1.0 ms
AO	3.5 ms
Blur	2.5 ms
Total	7.0 ms 143 fps

6 directions per pixel

6 steps per direction

15x15 Blur Size

SIGGRAPH 2008

NVIDIA.

Full-Resolution AO

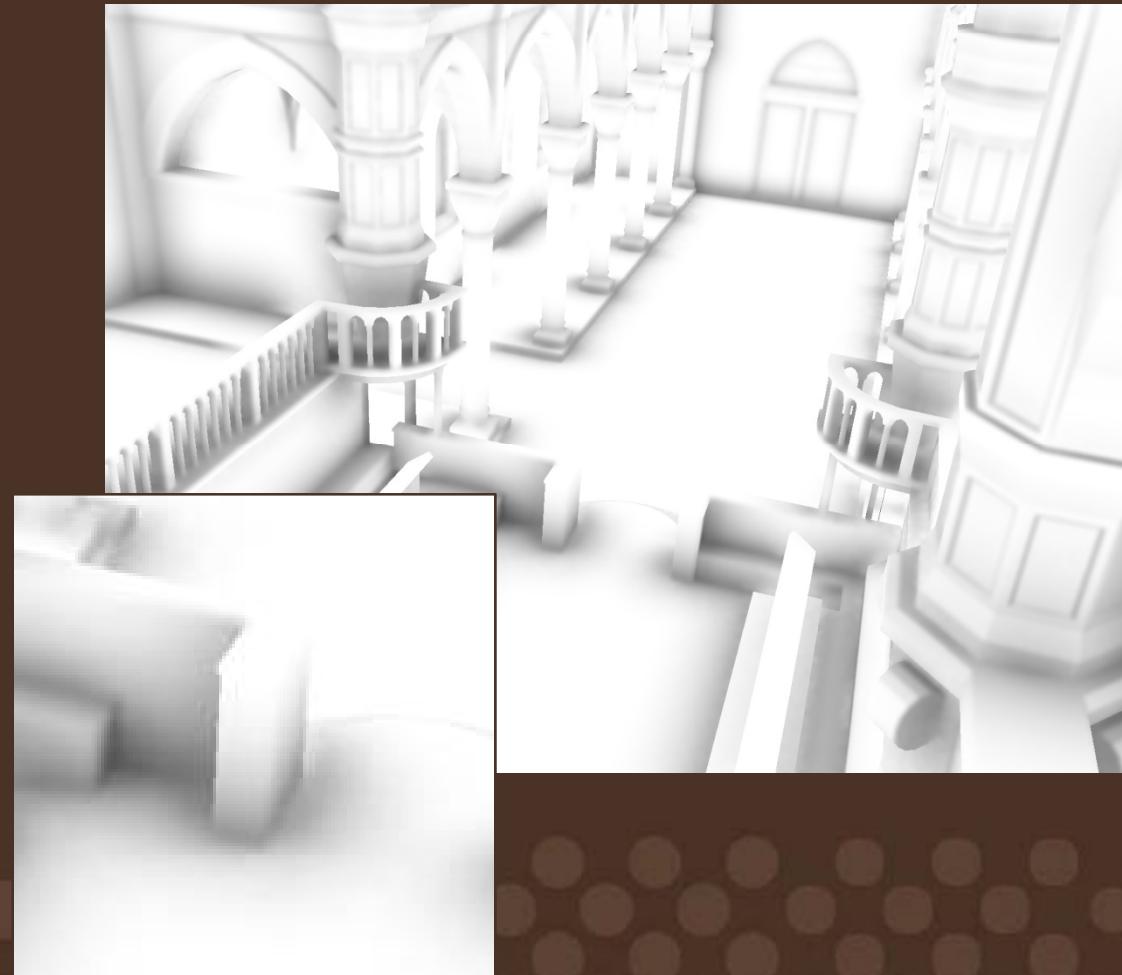

Image Size 1600x1200
AO Resolution 1600x1200
Blur Resolution 1600x1200

Full-Res AO	GeForce GTX 280
Geometry	1.0 ms
AO	30.0 ms
Blur	2.5 ms
Total	33.5 ms 30 fps

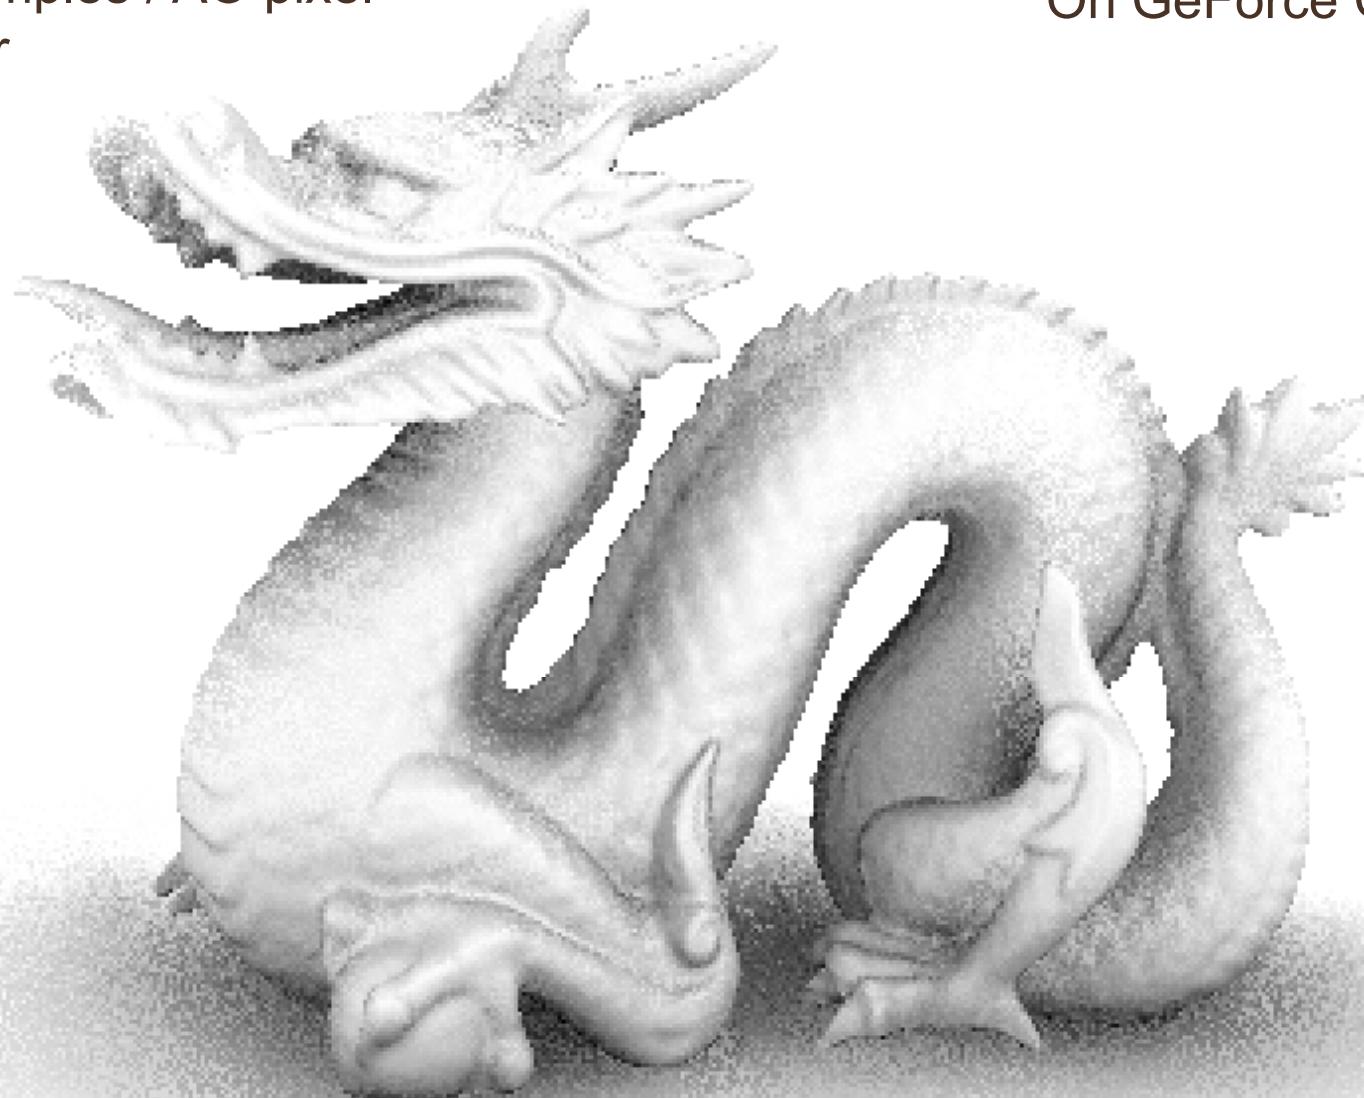

6 directions per pixel
6 steps per direction
15x15 Blur Size

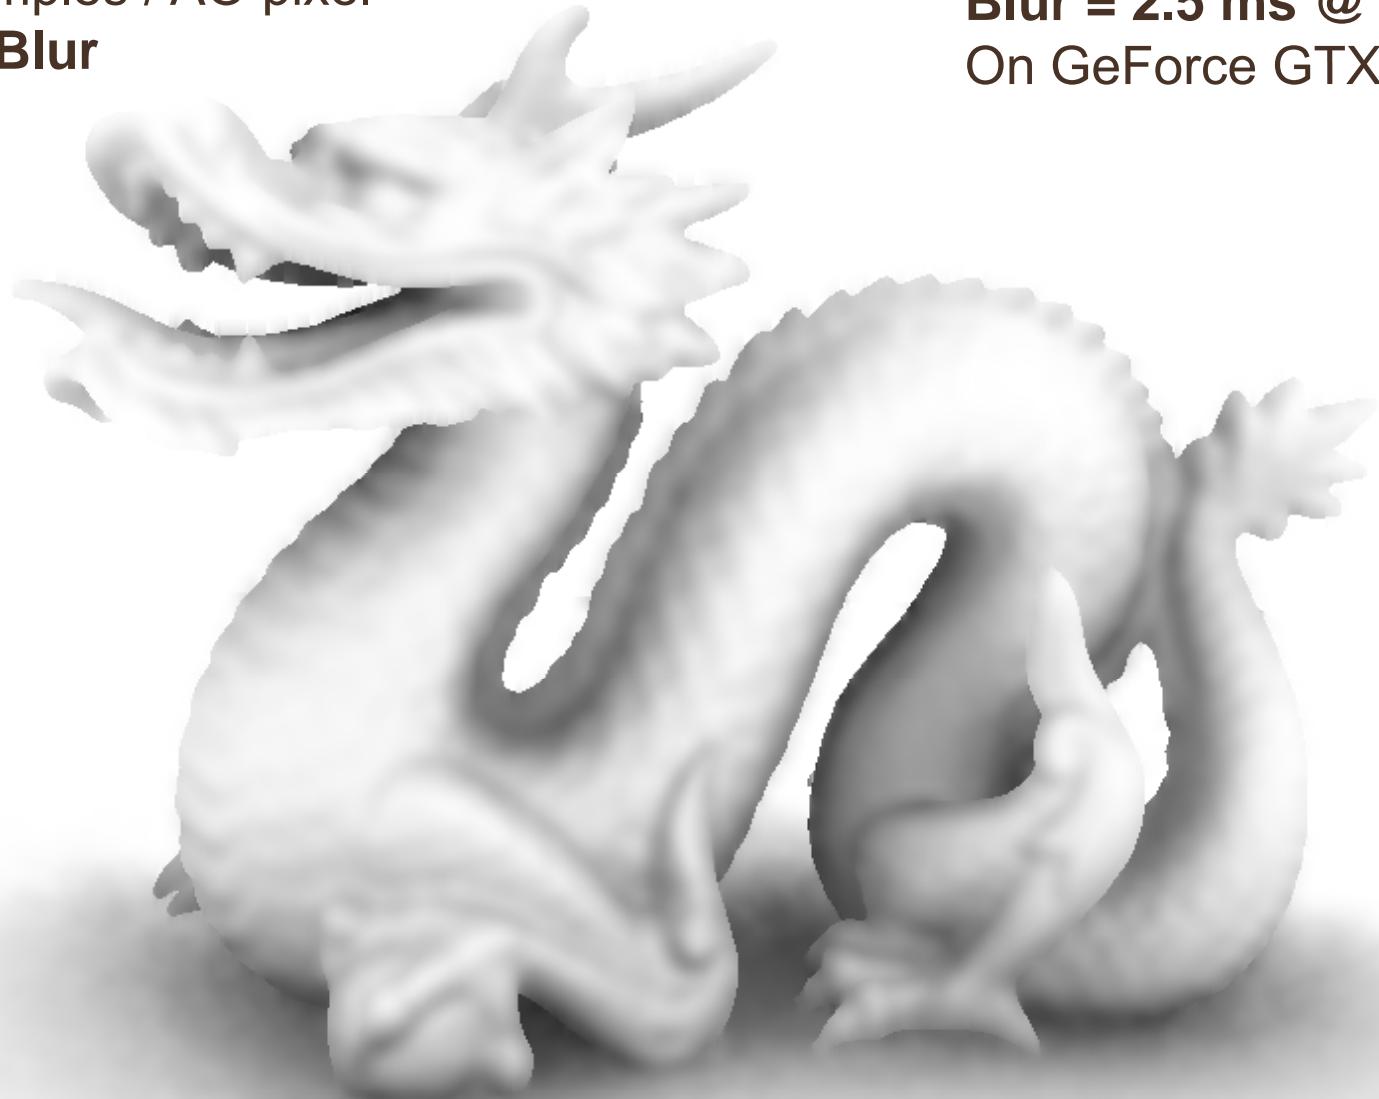

SIGGRAPH 2008

Half-Resolution AO
6x6 samples / AO pixel
No Blur

AO = 3.5 ms @ 800x600
On GeForce GTX 280

Half-Resolution AO
6x6 samples / AO pixel
15x15 Blur

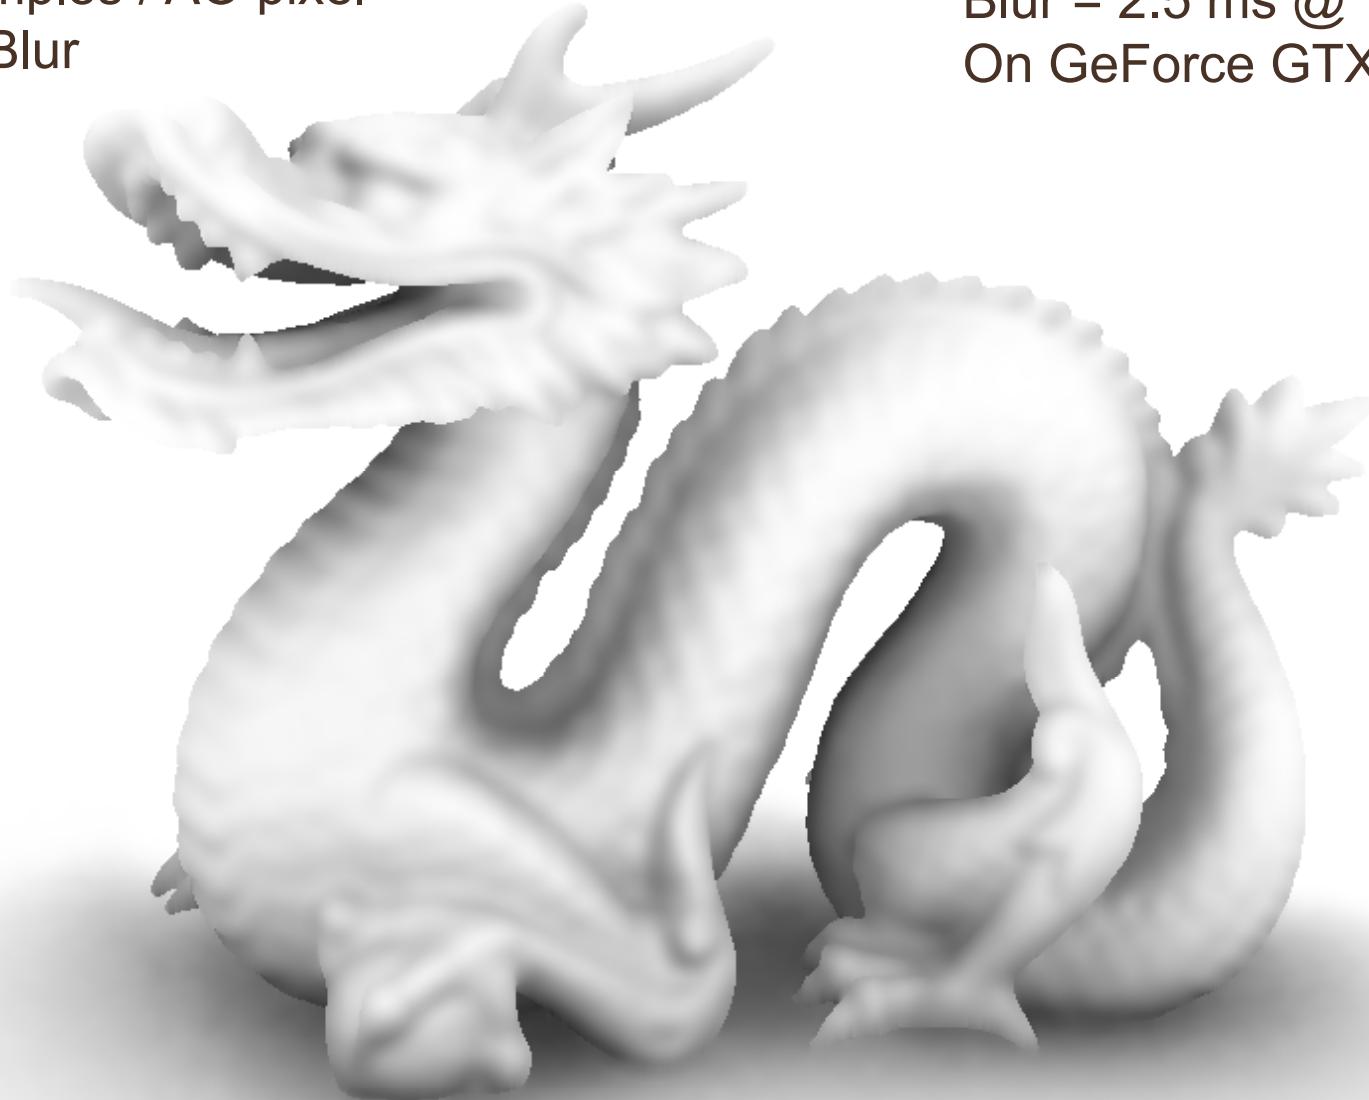

AO = 3.5 ms @ 800x600
Blur = 2.5 ms @ 1600x1200
On GeForce GTX 280

Full-Resolution AO

6x6 samples / AO pixel

15x15 Blur

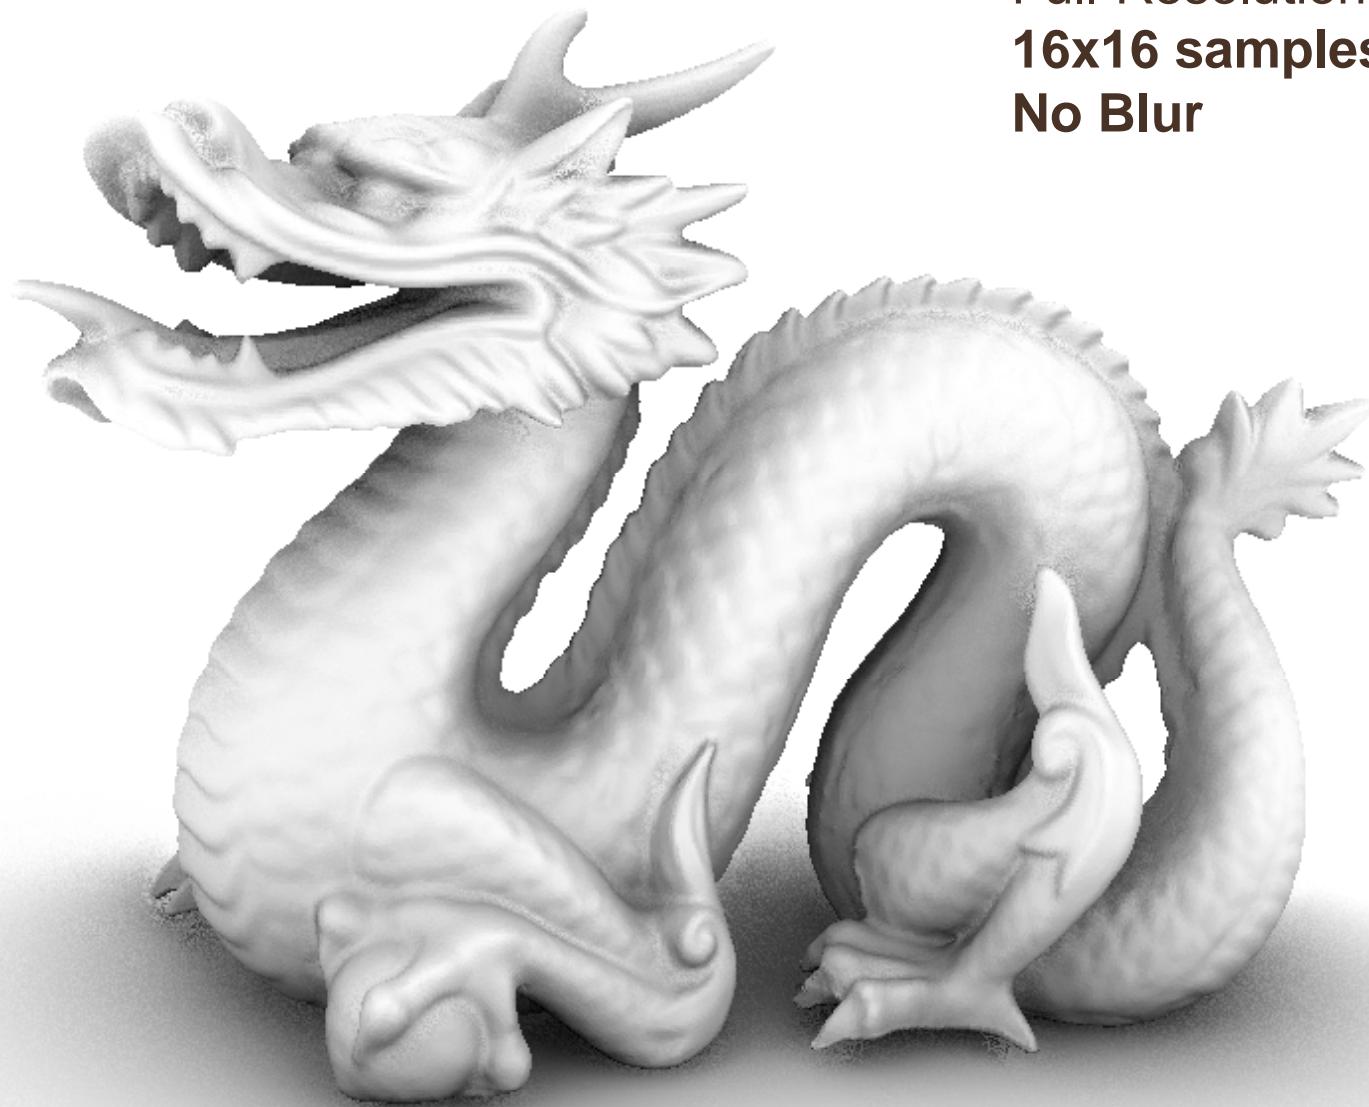

AO = 30 ms @ 800x600

Blur = 2.5 ms @ 1600x1200

On GeForce GTX 280

Full-Resolution AO
16x16 samples / pixel
No Blur

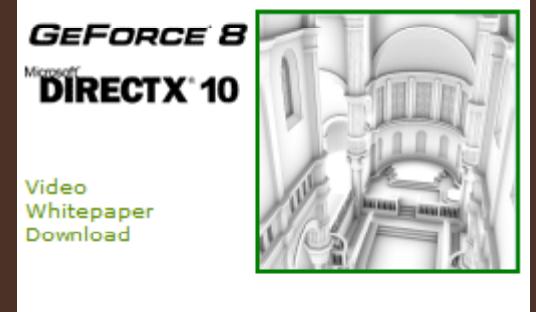

**Full-Resolution AO
16x32 samples / pixel
No Blur**

Conclusion

- DirectX10 SDK sample
 - Now available on developer.nvidia.com
 - Including video and brief whitepaper
- Easy to integrate into a game engine
 - Input Data = eye-space depths and normals
 - Rendered in a post-processing pass
- More details in ShaderX⁷ (to appear)

Acknowledgments

– NVIDIA

- Rouslan Dimitrov, Samuel Gateau, Michael Thompson, Ignacio Castano, the demo team

– Models

- Dragon - Stanford 3D Scanning Repository
- Sibenik Cathedral - Marko Dabrovic

NVIDIA.

Computing Eye-Space Positions

- For a given sample S at (u, v)

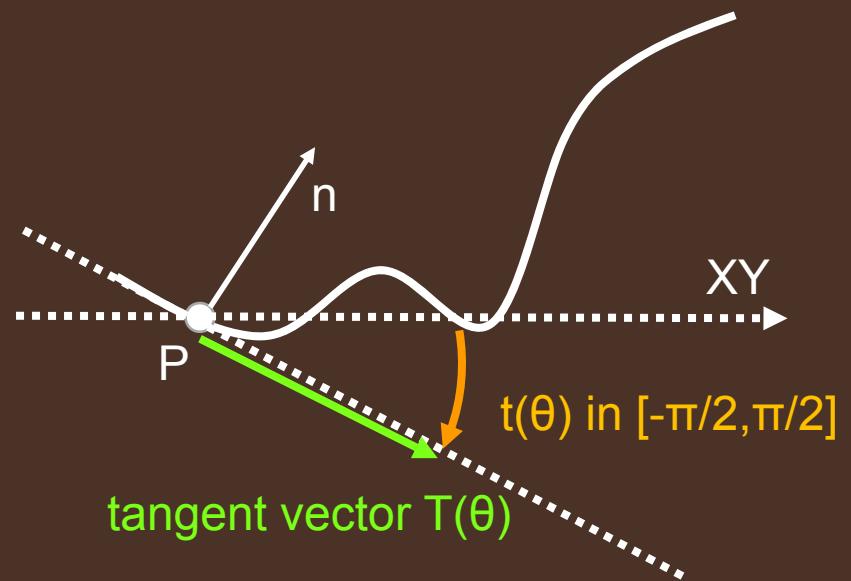

- Snap uv to avoid mismatch between reconstructed (x, y) and sampled z

NVIDIA.

Tangent Angle

- Given a tangent vector \mathbf{T}
 - $\mathbf{T}(\theta)$ on the plane
 - $t(\theta) = \text{atan}(\mathbf{T}.z / \|\mathbf{T}.xy\|)$
- Compute plane basis
 - Basis = $(d\mathbf{P}/du, d\mathbf{P}/dv)$
 - $\mathbf{T} = d\mathbf{P}/du \Delta u + d\mathbf{P}/dv \Delta v$
 - Similar to gradient shadow mapping [Schüler 05]
